

Book Problems

1. *Describe the null hypotheses to which the p-values given in Table 3.4 correspond. Explain what conclusions you can draw based on these p-values. Your explanation should be phrased in terms of sales, TV, radio, and newspaper, rather than in terms of the coefficients of the linear model.*

Sales Here is some testing.

TV

Radio

Newspaper

5. *Consider the fitted values that result from performing linear regression without an intercept. In this setting, the i th fitted value takes the form*

$$\hat{y}_i = x_i \hat{\beta},$$

where

$$\hat{\beta} = \left(\sum_{i=1}^n x_i y_i \right) / \left(\sum_{i'=1}^n x_{i'}^2 \right).$$

Show that we can write

$$\hat{y}_i = \sum_{i'=1}^n a_{i'} y_{i'}.$$

What is $a_{i'}$?

Note: We interpret this result by saying that the fitted values from linear regression are linear combinations of the response values.

6. *Using (3.4), argue that in the case of simple linear regression, the least squares line always passes through the point $(x?, y?)$.*

Challenge Problem

Use the identities for expected value and variance to derive the bias-variance decomposition of

$$E \left[\left(y - \hat{f}(x) \right)^2 \right].$$
